

Module 4; Notebook 1 - Creating and running a Python file

January 4, 2022

1 Module 4; Notebook 1 - Creating and running a Python file

Before we move onto the programming challenge of this workshop, let's see how we set-up a Python file in VS:

At the top nav bar of the window, go to **File** -> **New** which should open a new window in your version of VS. Now if you go to **File** -> **Save As** and then save your file anything with the with the file extension `.py` e.g. `coding_day_programming_challenge.py` - make sure it's memorable and saved in a folder you'll know!

Now you should be able to type out your code freely! To run your code hit the **Run** button at the top of your VS and you're away free!

When a Python script files you'll see an error message which will reference the line of the error - this is the best place to start when debugging!
